

There are a wide range of uses that can be used for aquariums in Liquid Galaxy-

1] With Liquid Galaxy, we can create a virtual tour of an aquarium with various types of fishes, plants and other creatures that are either extinct or preserved.

2] Leftmost and rightmost screens can be used as an information panel for the fishes, plants and other creatures that are appearing on the main screen. An instance is shown below-

3] We can create world map showing different options of tours of the oceans. We can select the one which we want to experience. It would be something similar to this-

4] With Liquid Galaxy, we can create a video encyclopedia of different fishes, plants and other creatures available. It would look great in panoramic mode.

5] With Liquid Galaxy, we can create an simulation about how a fish sees a world from its eyes. We can also show their lifecycle in the simulation. It would be quite an experience for everyone.

6] With Liquid Galaxy, we can create a sort of game for children where they have the liberty to feed the fishes, changing water level, changing the background scenario, adding or removing different varieties of fishes. This game can become quite popular among children

7] With Liquid Galaxy, we can create a tool with which a person can find the varieties of fishes available near a person's location through Google Earth.

8] We can attach a camera with the Liquid Galaxy setup and can imagine ourselves going inside through the oceans by using augmented reality.
