

There are a wide range of uses that can be used for botanical garden in Liquid Galaxy-

With Liquid Galaxy, we can create a virtual tour of a botanical garden with various types of trees, plants etc. that are either extinct or cannot survive in a particular location.

The leftmost and rightmost screens can be used as a panel which displays information about the various plants and trees that are visible on the screen

We can create world map showing different options of virtual tours around the world. We can select the one which we want to experience. It would be something similar to this-

With Liquid Galaxy, we can create a video encyclopedia of different plants, trees etc. available around the world. It would look great in panoramic mode.

With Liquid Galaxy, we can create a sort of game for children where they will have to grow a plant from scratch with seeds. They can choose to grow a variety of plants from different options available and can also control the environment in the game. This game can become quite popular among children.

With Liquid Galaxy, we can create a tool with which a person can find the botanical gardens available near a person's location through Google Earth
