

Use case for real time patient tracking at hospitals-

We can fit GPS in ambulances and with Liquid Galaxy, we can keep a track on the route of ambulance on the map. Due to the panoramic screen of Liquid Galaxy, it will be easier to keep a track on a huge network of ambulances around the city. It would look something like this-

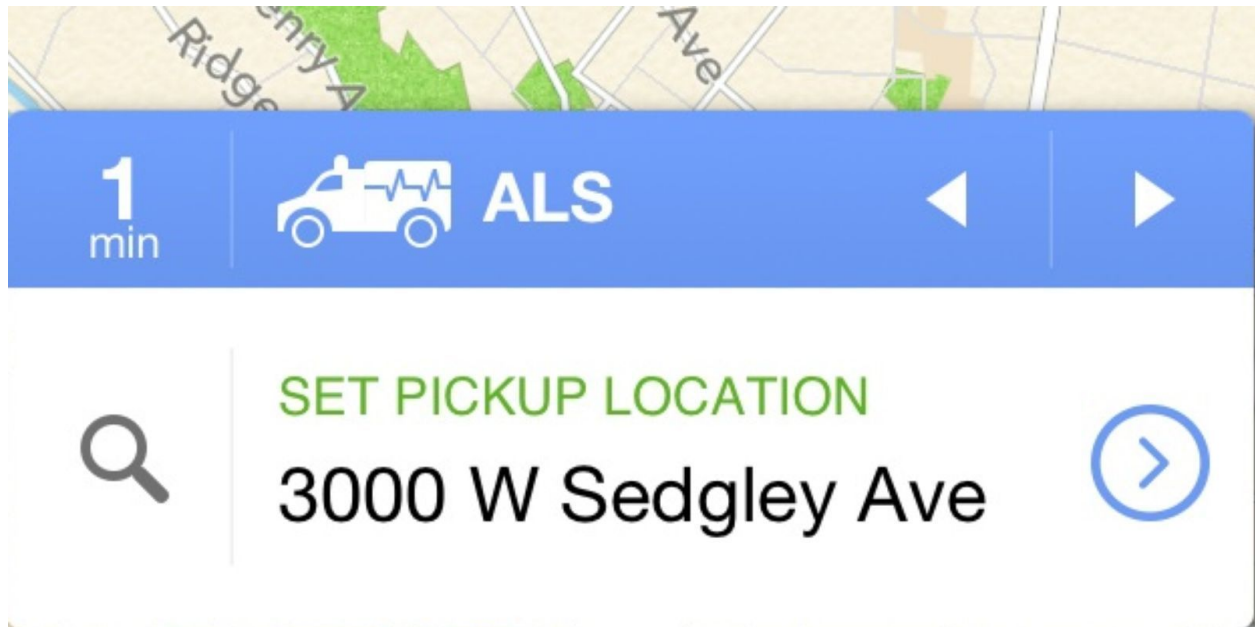

On the map showing the locations of various ambulances running on roads, we can prioritize them as safe, serious and life threatening and can make prior arrangements for them at the hospital.

We can use the leftmost and the rightmost screens to show different parameters for various patients on the screen like blood pressure, blood sugar level, oxygen level etc.

We can use Liquid Galaxy to receive messages from patients to pick them up through an app and can guide an ambulance towards them whichever is nearest to their location with the help of a huge map available on the panoramic screen. It would look something like this-

We can install a camera inside the ambulances and can get the live video updates about the condition of the patient and can make prior arrangements for them at the hospital. Due to panoramic screen of Liquid Galaxy, we can handle multiple patients at once.
